Please note that

• Released date: 17th Feb., 2022.

• **Due date**: 27th Feb., 2022. by 11:59pm.

• Late submission is **NOT** accepted.

- Please submit your answers as a PDF file with a name like "118010XXX_HW2.pdf" (Your student ID + HW No.). You may either typeset you answers directly using computers, or scan your handwritten answers. (We recommend you use the printers on campus to scan. If you use your smartphone to scan, please limit the file size ≤ 10MB).
- Please make sure that your submitted file is clear and readable. Submitted file that can not be opened or not readable will get 0 point.
- 1. Let

$$A = \left(\begin{array}{cc} a_{11} & a_{12} \\ a_{21} & a_{22} \end{array}\right)$$

Show that if $d = a_{11}a_{22} - a_{21}a_{12} \neq 0$, then

$$A^{-1} = \frac{1}{d} \begin{pmatrix} a_{22} & -a_{12} \\ -a_{21} & a_{11} \end{pmatrix}$$

Solution If $d = a_{11}a_{22} - a_{21}a_{12} \neq 0$ then $\frac{1}{d} \begin{pmatrix} a_{22} - a_{12} \\ -a_{21} & a_{11} \end{pmatrix} \begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix} = \begin{pmatrix} \frac{a_{11}a_{22} - a_{12}a_{21}}{d} & 0 \\ 0 & \frac{a_{11}a_{22} - a_{12}a_{21}}{d} \end{pmatrix} = I$ $\begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix} \begin{bmatrix} \frac{1}{d} \begin{pmatrix} a_{22} - a_{12} \\ -a_{21} & a_{11} \end{pmatrix} \end{bmatrix} = \begin{pmatrix} \frac{a_{11}a_{22} - a_{12}a_{21}}{d} & 0 \\ 0 & \frac{a_{11}a_{22} - a_{12}a_{21}}{d} \end{pmatrix} = I$ Therefore $\frac{1}{d} \begin{pmatrix} a_{22} & -a_{12} \\ -a_{21} & a_{11} \end{pmatrix} = A^{-1}$

2. Prove that if A is nonsingular then A^T is nonsingular and

$$\left(A^{T}\right)^{-1} = \left(A^{-1}\right)^{T}$$

Hint: $(AB)^T = B^T A^T$.

Solution

Since

$$A^{T} (A^{-1})^{T} = (A^{-1}A)^{T} = I$$

 $(A^{-1})^{T} A^{T} = (AA^{-1})^{T} = I$

it follows that

$$\left(A^{-1}\right)^T = \left(A^T\right)^{-1}$$

3. Let A be an $n \times n$ matrix. Show that if $A^2 = O$, then I - A is nonsingular and $(I - A)^{-1} = I + A$.

Solution

At first, we can construct two matrices B and C such that B = I - A and C = I + A. Then, we can compute $BC = (I - A)(I + A) = I^2 - A^2 = I$. Therefore, C is a multiplicative inverse of B, then (I - A) = B is nonsingular. In addition, $(I - A)^{-1} = C = I + A$.

4. Let A be an $n \times n$ matrix. Show that if $A^{k+1} = O$, then I - A is nonsingular and

$$(I - A)^{-1} = I + A + A^2 + \dots + A^k$$

Solution

At first, we can construct two matrices B and C such that B = I - A and $C = I + A + A^2 + \cdots + A^k$. Then, we can compute $BC = (I - A)(I + A + A^2 + \cdots + A^k) = I^2 + A + A^2 + \cdots + A^k - A - A^2 - A^3 - \cdots - A^k - A^{k+1} = I$. Therefore, C is a multiplicative inverse of B, then (I - A) = B is nonsingular. In addition, $(I - A)^{-1} = C = I + A + A^2 + \cdots + A^k$.

5. For each of the following pairs of matrices, find an elementary matrix E such that EA = B.

(a)
$$A = \begin{pmatrix} 2 & -1 \\ 5 & 3 \end{pmatrix}$$
, $B = \begin{pmatrix} -4 & 2 \\ 5 & 3 \end{pmatrix}$

(b)
$$A = \begin{pmatrix} 2 & 1 & 3 \\ -2 & 4 & 5 \\ 3 & 1 & 4 \end{pmatrix}$$
, $B = \begin{pmatrix} 2 & 1 & 3 \\ 3 & 1 & 4 \\ -2 & 4 & 5 \end{pmatrix}$

LGU-Course collected from Internet.

(c)
$$A = \begin{pmatrix} 4 & -2 & 3 \\ 1 & 0 & 2 \\ -2 & 3 & 1 \end{pmatrix}$$
, $B = \begin{pmatrix} 4 & -2 & 3 \\ 1 & 0 & 2 \\ 0 & 3 & 5 \end{pmatrix}$

Solution

(a) $E = \begin{pmatrix} -2 & 0 \\ 0 & 1 \end{pmatrix}$ (b) $E = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & 1 & 0 \end{pmatrix}$ (c) $E = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 2 & 1 \end{pmatrix}$

- 6. For each of the following pairs of matrices, find an elementary matrix E such that AE = B.
 - (a)

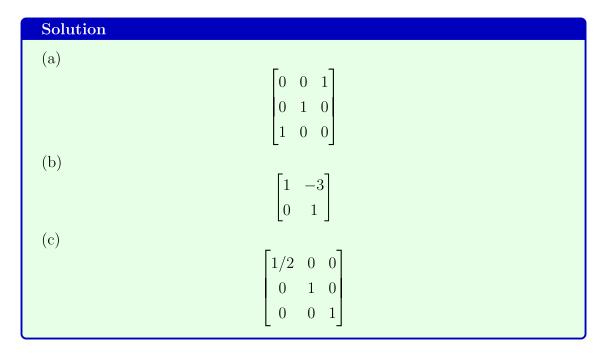

$$A = \begin{bmatrix} 4 & 1 & 3 \\ 2 & 1 & 4 \\ 1 & 3 & 2 \end{bmatrix}, B = \begin{bmatrix} 3 & 1 & 4 \\ 4 & 1 & 2 \\ 2 & 3 & 1 \end{bmatrix}$$

(b)

$$A = \begin{bmatrix} 2 & 4 \\ 1 & 6 \end{bmatrix}, B = \begin{bmatrix} 2 & -2 \\ 1 & 3 \end{bmatrix}$$

(c)

$$A = \begin{bmatrix} 4 & -2 & 3 \\ -2 & 4 & 2 \\ 6 & 1 & -2 \end{bmatrix}, B = \begin{bmatrix} 2 & -2 & 3 \\ -1 & 4 & 2 \\ 3 & 1 & -2 \end{bmatrix}$$

7. Let

$$A = \begin{bmatrix} 2 & 1 & 1 \\ 6 & 4 & 5 \\ 4 & 1 & 3 \end{bmatrix}$$

(a) Find elementary matrices E_1, E_2, E_3 such that

$$E_3 E_2 E_1 A = U$$

where U is an upper triangular matrix.

(b) Determine the inverses of E_1, E_2, E_3 and set $L = E_1^{-1} E_2^{-1} E_3^{-1}$. What type of matrix is L? Verify that A = LU.

(a)

$$\begin{bmatrix} 2 & 1 & 1 \\ 6 & 4 & 5 \\ 4 & 1 & 3 \end{bmatrix} \xrightarrow[R_3 \to R_3 - 2R_1]{R_2 \to R_2 - 3R_1} \begin{bmatrix} 2 & 1 & 1 \\ 0 & 1 & 2 \\ 0 & -1 & 1 \end{bmatrix} \xrightarrow[R_3 \to R_3 - (-1)R_2]{R_3 \to R_3 - (-1)R_2} \begin{bmatrix} 2 & 1 & 1 \\ 0 & 1 & 2 \\ 0 & 0 & 3 \end{bmatrix} = U$$

So

$$E_1 = \begin{bmatrix} 1 & 0 & 0 \\ -3 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}, E_2 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ -2 & 0 & 1 \end{bmatrix}, E_3 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 1 & 1 \end{bmatrix}.$$

(b)

$$E_{1}^{-1} = \begin{bmatrix} 1 & 0 & 0 \\ 3 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}, E_{2}^{-1} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 2 & 0 & 1 \end{bmatrix}, E_{3}^{-1} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & -1 & 1 \end{bmatrix},$$

$$L = E_{1}^{-1} E_{2}^{-1} E_{3}^{-1} = \begin{bmatrix} 1 & 0 & 0 \\ 3 & 1 & 0 \\ 2 & -1 & 1 \end{bmatrix}.$$

8. Compute the LU factorization of each of the following matrices.

(a)

$$\begin{bmatrix} 3 & 1 \\ 9 & 5 \end{bmatrix}$$

(b)

$$\begin{bmatrix} 2 & 4 \\ -2 & 1 \end{bmatrix}$$

(c)

$$\begin{bmatrix} 1 & 1 & 1 \\ 3 & 5 & 6 \\ -2 & 2 & 7 \end{bmatrix}$$

(d)

$$\begin{bmatrix} -2 & 1 & 2 \\ 4 & 1 & -2 \\ -6 & -3 & 4 \end{bmatrix}$$

Solution (a) $\begin{vmatrix} 3 & 1 \\ 9 & 5 \end{vmatrix} \xrightarrow{R_2 \to R_2 - 3R_1} \begin{vmatrix} 3 & 1 \\ 0 & 2 \end{vmatrix}$ So $U = \begin{bmatrix} 3 & 1 \\ 0 & 2 \end{bmatrix}, L = \begin{bmatrix} 1 & 0 \\ 3 & 1 \end{bmatrix}.$ (b) $\begin{vmatrix} 2 & 4 \\ -2 & 1 \end{vmatrix} \xrightarrow{R_2 \to R_2 - (-1)R_1} \begin{vmatrix} 2 & 4 \\ 0 & 5 \end{vmatrix}$ So $U = \begin{bmatrix} 2 & 4 \\ 0 & 5 \end{bmatrix}, L = \begin{bmatrix} 1 & 0 \\ -1 & 1 \end{bmatrix}.$ (c) $\begin{vmatrix} 1 & 1 & 1 \\ 3 & 5 & 6 \\ -2 & 2 & 7 \end{vmatrix} \xrightarrow{R_2 \to R_2 - 3R_1} \begin{vmatrix} 1 & 1 & 1 \\ 0 & 2 & 3 \\ 0 & 4 & 0 \end{vmatrix} \xrightarrow{R_3 \to R_3 - 2R_2} \begin{vmatrix} 1 & 1 & 1 \\ 0 & 2 & 3 \\ 0 & 0 & 3 \end{vmatrix}$ So $U = \begin{bmatrix} 1 & 1 & 1 \\ 0 & 2 & 3 \\ 0 & 0 & 2 \end{bmatrix}, L = \begin{bmatrix} 1 & 0 & 0 \\ 3 & 1 & 0 \\ -2 & 2 & 1 \end{bmatrix}.$ (d) $\begin{vmatrix} -2 & 1 & 2 \\ 4 & 1 & -2 \\ -6 & -3 & 4 \end{vmatrix} \xrightarrow{R_2 \to R_2 - (-2)R_1} \begin{vmatrix} -2 & 1 & 2 \\ 0 & 3 & 2 \\ -6 & -3 & 4 \end{vmatrix} \xrightarrow{R_3 \to R_3 - 3R_1} \begin{vmatrix} -2 & 1 & 2 \\ 0 & 3 & 2 \\ 0 & 0 & 2 \end{vmatrix}$ So $U = \begin{bmatrix} -2 & 1 & 2 \\ 0 & 3 & 2 \\ 0 & 0 & 2 \end{bmatrix}, L = \begin{bmatrix} 1 & 0 & 0 \\ -2 & 1 & 0 \\ 3 & -2 & 1 \end{bmatrix}.$

9. Let U and R be $n \times n$ upper triangular matrices and set T = UR. Show that T is also upper triangular and that $t_{jj} = u_{jj}r_{jj}$ for j = 1, ..., n.

Let $U = [u_{ij}]$ and $R = [r_{ij}]$ be upper triangular matrices. This implies that for every $i \geq j$, $u_{ij} = 0$ and $r_{ij} = 0$. Since T = UR, it follows that

$$t_{ij} = \sum_{n=0}^{k=1} u_{ik} r_{kj}, \quad i, j = 1, 2, ..., n.$$

when i > j: for each k = 1, 2, ..., n, we have that either k < i or $k \ge i$. This implies that either k < i or k > j. Therefore, either $u_{ik} = 0$ or $r_{kj} = 0$, for each k = 1, 2, ..., n. Thus, for every i > j, it follows that $t_{ij} = 0$. This is equivalent to the matrix T being upper triangular. when i = j: if i = k, then either i > k or i < k. In the first case we have that $u_{ik} = 0$, while in the second we have that $r_{ki} = 0$. Therefore, we can conclude the following:

$$\mathbf{t_{ii}} = \sum_{n=1}^{k=1} u_{ik} r_{ki} = \mathbf{u_{ii}} \mathbf{r_{ii}}, i = 1, 2, ..., n.$$

- 10. In general, matrix multiplication is not commutative (i.e., $AB \neq BA$). However, in certain special cases the commutative property does hold. Show that
 - (a) if D_1 and D_2 are $n \times n$ diagonal matrices, then $D_1D_2 = D_2D_1$.
 - (b) if A is an $n \times n$ matrix and

$$B = a_0 I + a_1 A + a_2 A^2 + a_k A^k$$

where $a_0, a_1, ..., a_k$ are scalars, then AB = BA.

(a)

$$(D_1 D_2)_{ij} = \sum_{k=1}^{n} (D_1)_{ik} (D_2)_{kj}$$

$$= \sum_{k=1}^{n} \delta_{ik} (D_1)_{ik} \delta_{kj} (D_2)_{kj}$$

$$= \delta_{ij} (D_1)_{ii} \delta_{kj} (D_2)_{ii}$$

$$= \delta_{ij} (D_2)_{ii} \delta_{kj} (D_1)_{ii}$$

$$= (D_2 D_1)_{ij}$$

where
$$\delta_{ij} = \begin{cases} 0, & i \neq j, \\ 1, & i = j, \end{cases}$$

(b)

$$AB = A (a_0 I + a_1 A + a_2 A^2 + \dots + a_k A^k)$$

$$= A (a_0 I) + A (a_1 A) + A (a_2 A^2) + \dots + A (a_k A^k)$$

$$= a_0 A I + a_1 A A + a_2 A A^2 + \dots + a_k A A^k$$

$$= a_0 A + a_1 A^2 + a_2 A^3 + \dots + a_k A^{k+1}$$

$$= a_0 I A + a_1 A A + a_2 A^2 A + \dots + a_k A^k A$$

$$= (a_0 I) A + (a_1 A) A + (a_2 A^2) A + \dots + (a_k A^k) A$$

$$= (a_0 I + a_1 A + a_2 A^2 + \dots + a_k A^k) A$$

$$= BA$$

11. Perform each of the following block multiplications:

(a)

$$\begin{bmatrix}
1 & 1 & 1 & | & -1 \\
2 & 1 & 2 & | & -1
\end{bmatrix}
\begin{bmatrix}
4 & -2 & 1 \\
2 & 3 & 1 \\
1 & 1 & 2 \\
\hline
1 & 2 & 3
\end{bmatrix}$$

(b)

$$\begin{bmatrix}
\frac{3}{5} & -\frac{4}{5} & 0 & 0 \\
\frac{4}{5} & \frac{3}{5} & 0 & 0 \\
0 & 0 & 1 & 0
\end{bmatrix}
\begin{bmatrix}
\frac{3}{5} & \frac{4}{5} & 0 \\
-\frac{4}{5} & \frac{3}{5} & 0 \\
0 & 0 & 1 \\
0 & 0 & 0
\end{bmatrix}$$

Solution

(a)

$$\begin{pmatrix} 1 & 1 & 1 \\ 2 & 1 & 2 \end{pmatrix} \begin{pmatrix} 4 & -2 & 1 \\ 2 & 3 & 1 \\ 1 & 1 & 2 \end{pmatrix} + \begin{pmatrix} -1 \\ -1 \end{pmatrix} \begin{pmatrix} 1 & 2 & 3 \end{pmatrix} = \begin{pmatrix} 6 & 0 & 1 \\ 11 & -1 & 4 \end{pmatrix}$$

(b) Let

$$A_{11} = \begin{pmatrix} \frac{3}{5} & -\frac{4}{5} \\ \frac{4}{5} & \frac{3}{5} \end{pmatrix} \quad A_{12} = \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}$$
$$A_{21} = \begin{pmatrix} 0 & 0 \\ \end{pmatrix} \quad A_{22} = \begin{pmatrix} 1 & 0 \\ \end{pmatrix}$$

The block multiplication is performed as follows:

$$\begin{pmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{pmatrix} \begin{pmatrix} A_{11}^T & A_{21}^T \\ A_{12}^T & A_{22}^T \end{pmatrix} = \begin{pmatrix} A_{11}A_{11}^T + A_{12}A_{12}^T & A_{11}A_{21}^T + A_{12}A_{22}^T \\ A_{21}A_{11}^T + A_{22}A_{12}^T & A_{21}A_{21}^T + A_{22}A_{22}^T \end{pmatrix}$$
$$= \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ \hline 0 & 0 & 1 \end{pmatrix}$$

12. Let

$$A = \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix} \quad \text{and} \quad A^T = \begin{bmatrix} A_{11}^T & A_{21}^T \\ A_{12}^T & A_{22}^T \end{bmatrix}$$

Is it possible to perform the block multiplications of AA^T and A^TA ? Explain.

It is possible to perform both block multiplications. To see this suppose that A_{11} is a $k \times r$ matrix, A_{12} is a $k \times (n-r)$ matrix, A_{21} is an $(m-k) \times r$ matrix and A_{22} is $(m-k) \times (n-r)$. It is possible to perform the block multiplication of AA^T since the matrix multiplication $A_{11}A_{11}^T$, $A_{11}A_{21}^T$, $A_{12}A_{12}^T$, $A_{12}A_{22}^T$, $A_{21}A_{11}^T$, $A_{21}A_{21}^T$, $A_{22}A_{12}^T$, $A_{22}A_{22}^T$ are all possible. It is possible to perform the block multiplication of A^TA since the matrix multiplications $A_{11}^TA_{11}$, $A_{11}^TA_{12}$, $A_{21}^TA_{21}$, $A_{21}^TA_{11}$, $A_{12}^TA_{12}$, $A_{22}^TA_{21}$, $A_{21}^TA_{21}$, $A_{21}^TA_$

13. Let A be an $m \times n$ matrix, X an $n \times r$ matrix, and B an $m \times r$ matrix. Show that

$$AX = B$$

if and only if

$$A\mathbf{x}_j = \mathbf{b}_j, \quad j = 1, \dots, r$$

Solution

$$AX = A(\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_r) = (A\mathbf{x}_1, A\mathbf{x}_2, \dots, A\mathbf{x}_r)$$

 $B = (\mathbf{b}_1, \mathbf{b}_2, \dots, \mathbf{b}_r)$

AX = B if and only if the column vectors of AX and B are equal

$$A\mathbf{x}_j = \mathbf{b}_j \quad j = 1, \dots, r$$

14. Let U be an $m \times m$ matrix, let V be an $n \times n$ matrix, and let

$$\Sigma = \left(\begin{array}{c} \Sigma_1 \\ O \end{array}\right)$$

where Σ_1 is an $n \times n$ diagonal matrix with diagonal entries $\sigma_1, \sigma_2, \ldots, \sigma_n$ and O is the $(m-n) \times n$ zero matrix.

(a) Show that if $U = (U_1, U_2)$, where U_1 has n columns, then

$$U\Sigma = U_1\Sigma_1$$

(b) Show that if $A = U\Sigma V^T$, then A can be expressed as an outer product expansion of the form

$$A = \sigma_1 \mathbf{u}_1 \mathbf{v}_1^T + \sigma_2 \mathbf{u}_2 \mathbf{v}_2^T + \dots + \sigma_n \mathbf{u}_n \mathbf{v}_n^T$$

(a)

$$U\Sigma = \begin{pmatrix} U_1 & U_2 \end{pmatrix} \begin{pmatrix} \Sigma_1 \\ O \end{pmatrix} = U_1\Sigma_1 + U_2O = U_1\Sigma_1$$

(b) If we let $X = U\Sigma$, then

$$X = U_1 \Sigma_1 = (\sigma_1 \mathbf{u}_1, \sigma_2 \mathbf{u}_2, \dots, \sigma_n \mathbf{u}_n)$$

and it follows that

$$A = U\Sigma V^T = XV^T = \sigma_1 \mathbf{u}_1 \mathbf{v}_1^T + \sigma_2 \mathbf{u}_2 \mathbf{v}_2^T + \dots + \sigma_n \mathbf{u}_n \mathbf{v}_n^T$$

15. Let A and B be $n \times n$ matrices and define $2n \times 2n$ matrices S and M by

$$S = \left(\begin{array}{cc} I & A \\ O & I \end{array}\right), \quad M = \left(\begin{array}{cc} AB & O \\ B & O \end{array}\right)$$

Determine the block form of S^{-1} and use it to compute the block form of the product $S^{-1}MS$.

Solution

The block form of S^{-1} is given by

$$S^{-1} = \begin{pmatrix} I & -A \\ O & I \end{pmatrix}$$
 It follows that

$$S^{-1}MS = \begin{pmatrix} I & -A \\ O & I \end{pmatrix} \begin{pmatrix} AB & O \\ B & O \end{pmatrix} \begin{pmatrix} I & A \\ O & I \end{pmatrix}$$
$$= \begin{pmatrix} I & -A \\ O & I \end{pmatrix} \begin{pmatrix} AB & ABA \\ B & BA \end{pmatrix}$$
$$= \begin{pmatrix} O & O \\ B & BA \end{pmatrix}$$
